Polymorphism

- Polymorphism is an object-oriented concept that allows us to create versatile software designs
- Chapter 10 focuses on:
 - defining polymorphism and its benefits
 - using inheritance to create polymorphic references
 - using interfaces to create polymorphic references
 - using polymorphism to implement sorting and searching algorithms

Binding

- Consider the following method invocation:

```
obj.doIt();
```

- At some point, this invocation is *bound* to the definition of the method that it invokes
- If this binding occurred at compile time, then that line of code would call the same method every time
- However, Java defers method binding until run time -- this is called *dynamic binding* or *late binding*

Copyright © 2017 Pearson Education, Inc.

Polymorphism

- The term *polymorphism* literally means "having many forms"
- A *polymorphic reference* is a variable that can refer to different types of objects at different points in time
- The method called through a polymorphic reference can change from one invocation to the next
- All object references in Java are potentially polymorphic

Copyright © 2017 Pearson Education, Inc.

Polymorphism

- Suppose we create the following reference variable:

```
Occupation job;
```

- This reference can point to an `Occupation` object, or to any object of any compatible type
- This compatibility can be established using inheritance or using interfaces
- Careful use of polymorphic references can lead to elegant, robust software designs

References and Inheritance

- An object reference can refer to an object of any class related to it by inheritance
- For example, if `Holiday` is the superclass of `Christmas`, then a `Holiday` reference could be used to refer to a `Christmas` object

Copyright © 2017 Pearson Education, Inc.

References and Inheritance

- These type compatibility rules are just an extension of the is-a relationship established by inheritance
- Assigning a `Christmas` object to a `Holiday` reference is fine because `Christmas` is-a `holiday`
- Assigning a child object to a parent reference can be performed by simple assignment
- Assigning an parent object to a child reference can be done also, but must be done with a cast
- After all, `Christmas` is a `holiday` but not all `holidays` are `Christmas`

Copyright © 2017 Pearson Education, Inc.

Polymorphism via Inheritance

- Now suppose the `Holiday` class has a method called `celebrate`, and `Christmas` overrides it
- What method is invoked by the following?

```
day.celebrate();
```
- The type of the object being referenced, not the reference type, determines which method is invoked
- If `day` refers to a `Holiday` object, it invokes the `Holiday` version of `celebrate`; if it refers to a `Christmas` object, it invokes that version

Copyright © 2017 Pearson Education, Inc.

Polymorphism via Inheritance

- Note that the compiler restricts invocations based on the type of the reference
- So if `Christmas` had a method called `getTree` that `Holiday` didn't have, the following would cause a compiler error:

```
day.getTree(); // compiler error
```

- Remember, the compiler doesn't "know" which type of holiday is being referenced
- A cast can be used to allow the call:

```
((Christmas) day).getTree();
```

Copyright © 2017 Pearson Education, Inc.

Quick Check

If `MusicPlayer` is the parent of `CDPlayer`, are the following assignments valid?

```
MusicPlayer mplayer = new CDPlayer();
```

Yes, because a `CDPlayer` is-a `MusicPlayer`

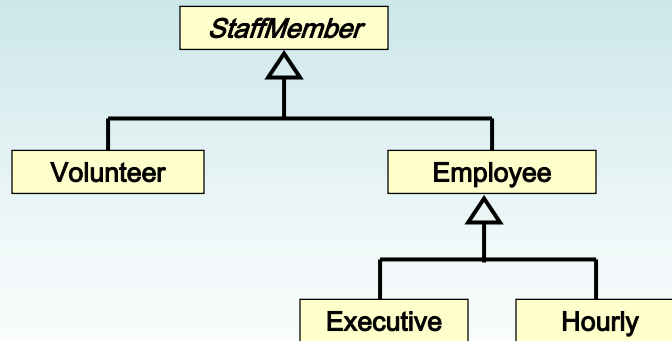

```
CDPlayer cdplayer = new MusicPlayer();
```

No, you'd have to use a cast (and you shouldn't knowingly assign a super class object to a subclass reference)

Polymorphism via Inheritance

- Consider the following class hierarchy:

Copyright © 2017 Pearson Education, Inc.

Polymorphism via Inheritance

- Let's look at an example that pays a set of diverse employees using a polymorphic method
- See `Firm.java`
- See `Staff.java`
- See `StaffMember.java`
- See `Volunteer.java`
- See `Employee.java`
- See `Executive.java`
- See `Hourly.java`

Outline

Late Binding

Polymorphism via Inheritance

Polymorphism via Interfaces

Sorting

Searching

Copyright © 2017 Pearson Education, Inc.

Polymorphism via Interfaces

- Interfaces can be used to set up polymorphic references as well
- Suppose we declare an interface called `Speaker` as follows:

```
public interface Speaker
{
    public void speak();
    public void announce(String str);
}
```

Copyright © 2017 Pearson Education, Inc.

Polymorphism via Interfaces

- An interface name can be used as the type of an object reference variable:
- ```
Speaker current;
```
- The `current` reference can be used to point to any object of any class that implements the `Speaker` interface
  - The version of `speak` invoked by the following line depends on the type of object that `current` is referencing:

```
current.speak();
```

Copyright © 2017 Pearson Education, Inc.

## Polymorphism via Interfaces

- Now suppose two classes, `Philosopher` and `Dog`, both implement the `Speaker` interface, providing distinct versions of the `speak` method
- In the following code, the first call to `speak` invokes one version and the second invokes another:

```
Speaker guest = new Philosopher();
guest.speak();
guest = new Dog();
guest.speak();
```

Copyright © 2017 Pearson Education, Inc.

## Polymorphism via Interfaces

- As with class reference types, the compiler will restrict invocations to methods in the interface
- For example, even if `Philosopher` also had a method called `pontificate`, the following would still cause a compiler error:

```
Speaker special = new Philosopher();
special.pontificate(); // compiler error
```

- Remember, the compiler bases its rulings on the type of the reference

Copyright © 2017 Pearson Education, Inc.

## Quick Check

Would the following statements be valid?

```
Speaker first = new Dog();
Philosopher second = new Philosopher();
second.pontificate();
first = second;
```

Yes, all assignments and method calls are valid as written

Copyright © 2017 Pearson Education, Inc.

## Outline

**Late Binding**

**Polymorphism via Inheritance**

**Polymorphism via Interfaces**

**Sorting**

**Searching**

Copyright © 2017 Pearson Education, Inc.

## Sorting

- *Sorting* is the process of arranging a list of items in a particular order
- The sorting process is based on specific criteria:
  - sort test scores in ascending numeric order
  - sort a list of people alphabetically by last name
- There are many algorithms, which vary in efficiency, for sorting a list of items
- We will examine two specific algorithms:
  - Selection Sort
  - Insertion Sort

Copyright © 2017 Pearson Education, Inc.

## Selection Sort

- The strategy of Selection Sort:
  - select a value and put it in its final place in the list
  - repeat for all other values
- In more detail:
  - find the smallest value in the list
  - switch it with the value in the first position
  - find the next smallest value in the list
  - switch it with the value in the second position
  - repeat until all values are in their proper places

Copyright © 2017 Pearson Education, Inc.

## Selection Sort

Copyright © 2017 Pearson Education, Inc.

## Swapping

- The processing of the selection sort algorithm includes the *swapping* of two values
- Swapping requires three assignment statements and a temporary storage location
- To swap the values of `first` and `second`:

```
temp = first;
first = second;
second = temp;
```

Copyright © 2017 Pearson Education, Inc.

## Polymorphism in Sorting

- Recall that a class that implements the `Comparable` interface defines a `compareTo` method to determine the relative order of its objects
- We can use polymorphism to develop a generic sort for any set of `Comparable` objects
- The sorting method accepts as a parameter an array of `Comparable` objects
- That way, one method can be used to sort an array of `People`, or `Books`, or whatever

Copyright © 2017 Pearson Education, Inc.

## Selection Sort

- This technique allows each class to decide for itself what it means for one object to be less than another
- Let's look at an example that sorts an array of `Contact` objects
- The `selectionSort` method is a static method in the `Sorting` class
- See `PhoneList.java`
- See `Sorting.java`
- See `Contact.java`

Copyright © 2017 Pearson Education, Inc.

```

//*****
// PhoneList.java Author: Lewis/Loftus
//
// Driver for testing a sorting algorithm.
//*****

public class PhoneList
{
 //-----
 // Creates an array of Contact objects, sorts them, then prints
 // them.
 //-----
 public static void main(String[] args)
 {
 Contact[] friends = new Contact[8];

 friends[0] = new Contact("John", "Smith", "610-555-7384");
 friends[1] = new Contact("Sarah", "Barnes", "215-555-3827");
 friends[2] = new Contact("Mark", "Riley", "733-555-2969");
 friends[3] = new Contact("Laura", "Getz", "663-555-3984");
 friends[4] = new Contact("Larry", "Smith", "464-555-3489");
 friends[5] = new Contact("Frank", "Phelps", "322-555-2284");
 friends[6] = new Contact("Mario", "Guzman", "804-555-9066");
 friends[7] = new Contact("Marsha", "Grant", "243-555-2837");

 continue
 }
}

```

Copyright © 2017 Pearson Education, Inc.

```

 continue

 Sorting.selectionSort(friends);

 for (Contact friend : friends)
 System.out.println(friend);
 }
}

```

Copyright © 2017 Pearson Education, Inc.

**continue**

```
Sorting.select
 for (Contact c in list)
 System.out.println(c)
 }
```

## Output

|               |              |
|---------------|--------------|
| Barnes, Sarah | 215-555-3827 |
| Getz, Laura   | 663-555-3984 |
| Grant, Marsha | 243-555-2837 |
| Guzman, Mario | 804-555-9066 |
| Phelps, Frank | 322-555-2284 |
| Riley, Mark   | 733-555-2969 |

## The static selectionSort method in the Sorting class:

```
//-----
// Sorts the specified array of objects using the selection
// sort algorithm.
//-----
public static void selectionSort(Comparable[] list)
{
 int min;
 Comparable temp;

 for (int index = 0; index < list.length-1; index++)
 {
 min = index;
 for (int scan = index+1; scan < list.length; scan++)
 if (list[scan].compareTo(list[min]) < 0)
 min = scan;

 // Swap the values
 temp = list[min];
 list[min] = list[index];
 list[index] = temp;
 }
}
```

Copyright © 2017 Pearson Education, Inc.

```

//*****
// Contact.java Author: Lewis/Loftus
//
// Represents a phone contact.
//*****

public class Contact implements Comparable
{
 private String firstName, lastName, phone;

 //-----
 // Constructor: Sets up this contact with the specified data.
 //-----
 public Contact(String first, String last, String telephone)
 {
 firstName = first;
 lastName = last;
 phone = telephone;
 }
}

```

continue

Copyright © 2017 Pearson Education, Inc.

continue

```

//-----
// Returns a description of this contact as a string.
//-----
public String toString()
{
 return lastName + ", " + firstName + "\t" + phone;
}

//-----
// Returns a description of this contact as a string.
//-----
public boolean equals(Object other)
{
 return (lastName.equals(((Contact)other).getLastName()) &&
 firstName.equals(((Contact)other).getFirstName()));
}

```

continue

Copyright © 2017 Pearson Education, Inc.

continue

```
//-----
// Uses both last and first names to determine ordering.
//-----
public int compareTo(Object other)
{
 int result;

 String otherFirst = ((Contact)other).getFirstName();
 String otherLast = ((Contact)other).getLastName();

 if (lastName.equals(otherLast))
 result = firstName.compareTo(otherFirst);
 else
 result = lastName.compareTo(otherLast);

 return result;
}
```

continue

Copyright © 2017 Pearson Education, Inc.

continue

```
//-----
// First name accessor.
//-----
public String getFirstName()
{
 return firstName;
}

//-----
// Last name accessor.
//-----
public String getLastName()
{
 return lastName;
}
}
```

Copyright © 2017 Pearson Education, Inc.

# Insertion Sort

- The strategy of Insertion Sort:
  - pick any item and insert it into its proper place in a sorted sublist
  - repeat until all items have been inserted
- In more detail:
  - consider the first item to be a sorted sublist (of one item)
  - insert the second item into the sorted sublist, shifting the first item as needed to make room to insert the new one
  - insert the third item into the sorted sublist (of two items), shifting items as necessary
  - repeat until all values are inserted into their proper positions

Copyright © 2017 Pearson Education, Inc.

# Insertion Sort

3 is sorted.  
Shift nothing. Insert 9.

3 and 9 are sorted.  
Shift 9 to the right. Insert 6.

3, 6 and 9 are sorted.  
Shift 9, 6, and 3 to the right. Insert 1.

1, 3, 6 and 9 are sorted.  
Shift 9, 6, and 3 to the right. Insert 2.

All values are sorted.

Copyright © 2017 Pearson Education, Inc.

## The static `insertionSort` method in the `Sorting` class:

```
//-----
// Sorts the specified array of objects using the insertion
// sort algorithm.
//-----
public static void insertionSort(Comparable[] list)
{
 for (int index = 1; index < list.length; index++)
 {
 Comparable key = list[index];
 int position = index;

 // Shift larger values to the right
 while (position > 0 && key.compareTo(list[position-1]) < 0)
 {
 list[position] = list[position-1];
 position--;
 }

 list[position] = key;
 }
}
```

Copyright © 2017 Pearson Education, Inc.

## Comparing Sorts

- The Selection and Insertion sort algorithms are similar in efficiency
- They both have outer loops that scan all elements, and inner loops that compare the value of the outer loop with almost all values in the list
- Approximately  $n^2$  number of comparisons are made to sort a list of size  $n$
- We therefore say that these sorts are of *order  $n^2$*
- Other sorts are more efficient: *order  $n \log_2 n$*

## Outline

Late Binding

Polymorphism via Inheritance

Polymorphism via Interfaces

Sorting

 Searching

Copyright © 2017 Pearson Education, Inc.

## Searching

- *Searching* is the process of finding a *target element* within a group of items called the *search pool*
- The target may or may not be in the search pool
- We want to perform the search efficiently, minimizing the number of comparisons
- Let's look at two classic searching approaches: linear search and binary search
- As we did with sorting, we'll implement the searches with polymorphic `Comparable` parameters

Copyright © 2017 Pearson Education, Inc.

## Linear Search

- A linear search begins at one end of a list and examines each element in turn
- Eventually, either the item is found or the end of the list is encountered

Copyright © 2017 Pearson Education, Inc.

## Binary Search

- A *binary search* assumes the list of items in the search pool is sorted
- It eliminates a large part of the search pool with a single comparison
- A binary search first examines the middle element of the list -- if it matches the target, the search is over
- If it doesn't, only one half of the remaining elements need be searched
- Since they are sorted, the target can only be in one half of the other

Copyright © 2017 Pearson Education, Inc.

## Binary Search

- The process continues by comparing the middle element of the remaining *viable candidates*
- Each comparison eliminates approximately half of the remaining data
- Eventually, the target is found or the data is exhausted

Copyright © 2017 Pearson Education, Inc.

## Searching

- The search methods are implemented as static methods in the `Searching` class
- See `PhoneList2.java`
- See `Searching.java`

```

//*****
// PhoneList2.java Author: Lewis/Loftus
//
// Driver for testing searching algorithms.
//*****

public class PhoneList2
{
 //-----
 // Creates an array of Contact objects, sorts them, then prints
 // them.
 //-----
 public static void main(String[] args)
 {
 Contact test, found;
 Contact[] friends = new Contact[8];

 friends[0] = new Contact("John", "Smith", "610-555-7384");
 friends[1] = new Contact("Sarah", "Barnes", "215-555-3827");
 friends[2] = new Contact("Mark", "Riley", "733-555-2969");
 friends[3] = new Contact("Laura", "Getz", "663-555-3984");
 friends[4] = new Contact("Larry", "Smith", "464-555-3489");
 friends[5] = new Contact("Frank", "Phelps", "322-555-2284");
 friends[6] = new Contact("Mario", "Guzman", "804-555-9066");
 friends[7] = new Contact("Marsha", "Grant", "243-555-2837");
 }
}

```

continue

continue

```

test = new Contact("Frank", "Phelps", "");
found = (Contact) Searching.linearSearch(friends, test);
if (found != null)
 System.out.println("Found: " + found);
else
 System.out.println("The contact was not found.");
System.out.println();

Sorting.selectionSort(friends);

test = new Contact("Mario", "Guzman", "");
found = (Contact) Searching.binarySearch(friends, test);
if (found != null)
 System.out.println("Found: " + found);
else
 System.out.println("The contact was not found.");
}
}

```

continue

**Output**

```

test = new Contact("Phelps", "Frank", "322-555-2284");
found = (Contact) Searching.binarySearch(friends, test);
if (found != null)
 System.out.println("Found: " + found);
else
 System.out.println("The contact was not found.");
System.out.println();

Sorting.selectionSort(friends);

test = new Contact("Mario", "Guzman", "");
found = (Contact) Searching.binarySearch(friends, test);
if (found != null)
 System.out.println("Found: " + found);
else
 System.out.println("The contact was not found.");
}
}

```

## The linearSearch method in the Searching class:

```

//-----
// Searches the specified array of objects for the target using
// a linear search. Returns a reference to the target object from
// the array if found, and null otherwise.
//-----
public static Comparable linearSearch(Comparable[] list,
 Comparable target)
{
 int index = 0;
 boolean found = false;

 while (!found && index < list.length)
 {
 if (list[index].equals(target))
 found = true;
 else
 index++;
 }

 if (found)
 return list[index];
 else
 return null;
}

```

## The binarySearch method in the Searching class:

```
//-----
// Searches the specified array of objects for the target using
// a binary search. Assumes the array is already sorted in
// ascending order when it is passed in. Returns a reference to
// the target object from the array if found, and null otherwise.
//-----
public static Comparable binarySearch(Comparable[] list,
 Comparable target)
{
 int min=0, max=list.length, mid=0;
 boolean found = false;

 while (!found && min <= max)
 {
 mid = (min+max) / 2;
 if (list[mid].equals(target))
 found = true;
 else
 if (target.compareTo(list[mid]) < 0)
 max = mid-1;
 else
 min = mid+1;
 }

 continue
}
```

```
continue

 if (found)
 return list[mid];
 else
 return null;
}
```

## Summary

- Chapter 10 has focused on:
  - defining polymorphism and its benefits
  - using inheritance to create polymorphic references
  - using interfaces to create polymorphic references
  - using polymorphism to implement sorting and searching algorithms
